Tutorial on Universal Dependencies

Cross-linguistically consistent syntactic annotation

Cross-lingual Syntax

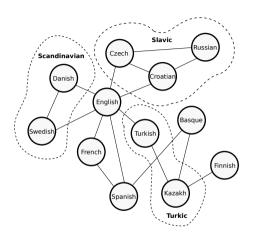

How can we do cross-lingual syntax ?

- ► Find the structures we expect to find in all languages
- Describe how they are dealt with
 - Using a representation that facilitates cross-linguistic parallelism
- ► Allow language-specific extensions

Approaches

UD tries to standardise between languages, and particularly:

- ► Within language groups
- Between typologically similar constructions

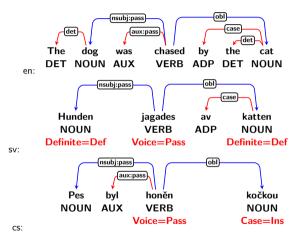

Syntactic Annotation in UD

- ► Basic principles:
 - ► The primacy of content words
 - Clauses, nominals and modifier words
 - Core arguments vs. oblique dependents
- Universal and language-specific relations
- Basic and enhanced dependencies

The Primacy of Content Words

5

Three Types of Structures

The dog	chased	the cat	from the room
entity	event	entity	attribute
NOMINAL	CLAUSE	NOMINAL	MODIFIER

Core Arguments

- Arguments of basic intransitive and transitive verbs
- Distinguished by one or more of the following properties:
 - Verbs usually only agree with core arguments
 - ► Core arguments normally appear without adpositions
 - Certain cases, traditionally called nominative, accusative, and absolutive are typically reserved core arguments
 - Core arguments often occupy special positions in the clause
 - Syntactic phenomena like control, relativisation and passivisation can be restricted to core arguments
- ▶ UD distinguishes core arguments from oblique dependents
- ▶ UD does not distinguish arguments from adjuncts

Syntactic Relations

	Nominal	Clause	Modifier Word	Function Word
Core Predicate Dep	nsubj obj iobj	csubj ccomp xcomp		
Non-Core Predicate Dep	obl vocative expl dislocated	advcl	advmod* discourse	aux cop mark
Nominal Dep	nmod appos nummod	acl	amod	det clf case
Coordination	MWE	Loose	Special	Other
conj cc	fixed flat compound	parataxis list	orphan goeswith reparandum	punct root dep

 $[\]ensuremath{^{*}}$ Generalized modifier of predicates and (non-nominal) modifiers

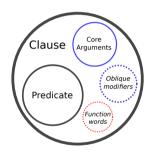

A Two-Level Architecture

- ► Universal relations
 - ▶ Broad categories to allow cross-linguistic comparison
- ► Language-specific relations
 - Subtypes to capture language-specific phenomena

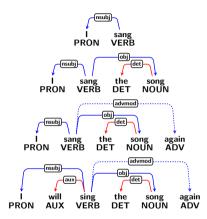

Universal	Language-Specific	
acl	acl:relcl	
compound	compound:prt	
nmod	nmod:poss	

Clauses

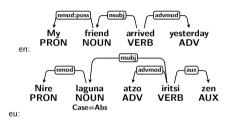

- Basic universal structure
- ▶ Distinguish *core* from *oblique*
- Function words are leaf nodes

Intransitive

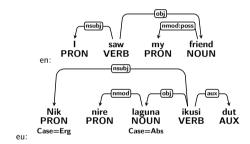

► Single argument, nsubj

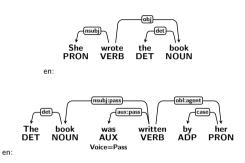

Transitive

- ► Two arguments,
 - ▶ nsubj: The proto-Agent
 - ▶ obj: The proto-Patient
- ► Language-internal criteria
 - Case marking
 - Word order
 - Agreement
 - Valency changes
- ► Not exclusively case/semantic role

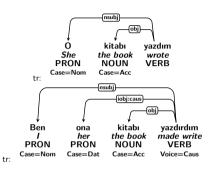

Valency Changing

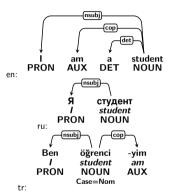

- ► Annotate syntax, not semantic role
- Optional use of subtypes for:
 - Passive
 - Causative

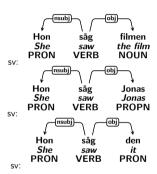

- ► At most one copula item
 - Semantically empty
- Predicate is head
- ► Types:
 - Equational
 - Attributional
 - Locational

Nominal Phrases

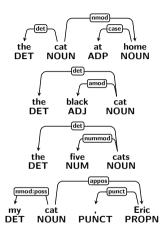

- ► Basic cross-lingual structure
- ► Headed by a noun, proper noun or pronoun
- Do not take core arguments

► The type of dependent determines the label for the adnominal modifier:

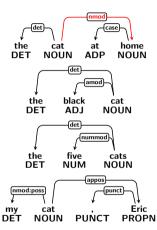

Nominal nmod Adjectival amod Numeral nummod

► The type of dependent determines the label for the adnominal modifier:

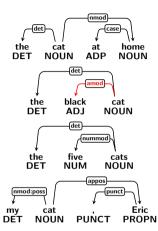

Nominal nmod Adjectival amod Numeral nummod

► The type of dependent determines the label for the adnominal modifier:

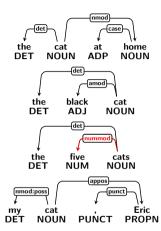

Nominal nmod
Adjectival amod
Numeral nummod

► The type of dependent determines the label for the adnominal modifier:

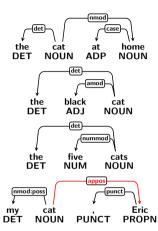

Nominal nmod Adjectival amod Numeral nummod

► The type of dependent determines the label for the adnominal modifier:

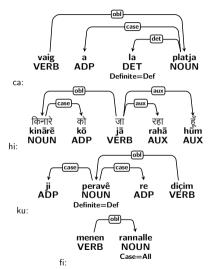

Nominal nmod Adjectival amod Numeral nummod

Adpositional Phrases

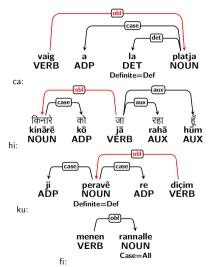

- ► Single part-of-speech tag, ADP
- Adpositions attach to the head of the nominal phrase
 - relation: case
- ► Adpositional phrases are attached to
 - clausal heads: obl
 - nominal heads: nmod
- ► Parallel with oblique NPs

Adpositional Phrases

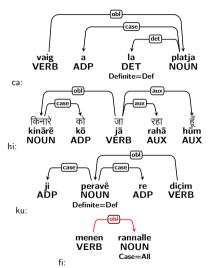

- ► Single part-of-speech tag, ADP
- Adpositions attach to the head of the nominal phrase
 - relation: case
- ► Adpositional phrases are attached to
 - clausal heads: obl
 - nominal heads: nmod
- ► Parallel with oblique NPs

Adpositional Phrases

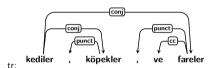

- ► Single part-of-speech tag, ADP
- Adpositions attach to the head of the nominal phrase
 - relation: case
- ► Adpositional phrases are attached to
 - clausal heads: obl
 - nominal heads: nmod
- ► Parallel with oblique NPs

Coordination

- Coordination is not a dependency relation
- ► The "head" (parent node) is the first conjunct

Subordination

Complex clauses involving subordination arise because a core or non-core dependent is realised as a clausal structure Four basic types:

Core	Non-core
Clausal subjects	Adverbial clause modifiers
Clausal complements	Adnominal clause modifiers

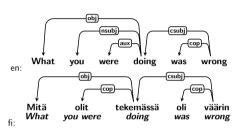

These may be either finite or non-finite

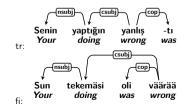

Clausal Subjects

- When the role of subject is filled by a clause
- Relation is csubj
- Sometimes blurry:
 - "His writing surprised me"

Finite

Non-finite

Clausal Complements

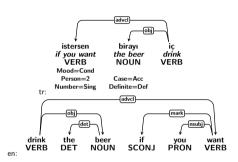

- ➤ Closed: The subject of the subordinate clause is not co-referential with an argument of the matrix clause
- ▶ Open: The subject of the subordinate clause is controlled by the matrix clause

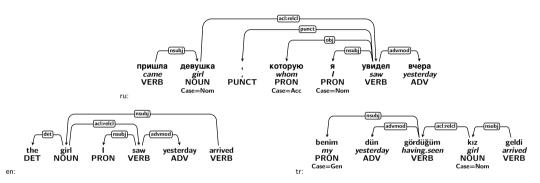

Adverbial Clauses

- ► Clause modifier of verb or other predicate
- ▶ Non-core complement, e.g.
 - Temporal clause
 - Conditional clause
 - Purpose clause
 - **.**

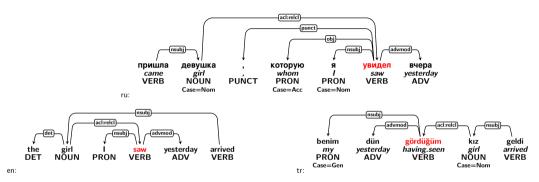

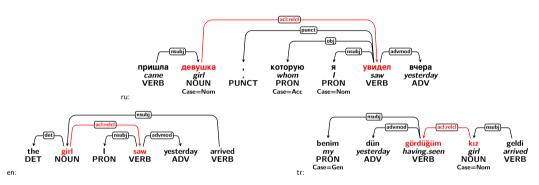

- ▶ The predicate is head of the relative clause
- ▶ The relative clause depends on the nominal it modifies
- Arguments (incl. relative pronouns) and modifiers annotated as in main clauses

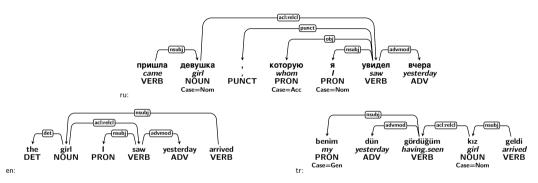

- ► The predicate is head of the relative clause
- ▶ The relative clause depends on the nominal it modifies
- Arguments (incl. relative pronouns) and modifiers annotated as in main clauses

- ▶ The predicate is head of the relative clause
- ▶ The relative clause depends on the nominal it modifies
- Arguments (incl. relative pronouns) and modifiers annotated as in main clauses

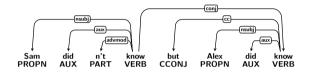

- ▶ The predicate is head of the relative clause
- ▶ The relative clause depends on the nominal it modifies
- Arguments (incl. relative pronouns) and modifiers annotated as in main clauses

Ellipsis: Promotion

- ▶ No empty nodes in the basic representation
- Function words are promoted when their heads are elided
- ▶ Real dependencies recovered in the enhanced representation

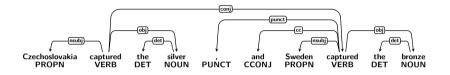

Ellipsis: Promotion

- No empty nodes in the basic representation
- Function words are promoted when their heads are elided
- ▶ Real dependencies recovered in the enhanced representation

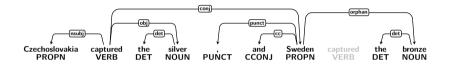

Ellipsis: Orphan

- ▶ When promotion would result in a misleading dependency relation
 - e.g. an object depending on a subject
- ▶ Typical case: core argument promotion in predicate ellipsis
- Maintains clausal integrity

Ellipsis: Orphan

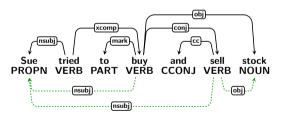

- ▶ When promotion would result in a misleading dependency relation
 - e.g. an object depending on a subject
- ► Typical case: core argument promotion in predicate ellipsis
- Maintains clausal integrity

Enhanced Dependencies

- An extended dependency graph containing:
 - Null nodes for elided predicates
 - ▶ Additional subject relations for control and raising constructions
 - Propagation of dependents over coordination
 - Coreference in relative clause constructions
 - Labels augmented with function word information

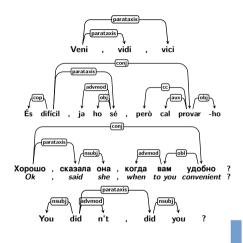

Questions?

Parataxis:

- ► Side-by-side sentences
- Parentheticals
- Some kinds of reported speech
- ► Tag questions

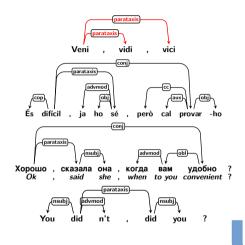

List:

Parataxis:

- Side-by-side sentences

 - Semantically empty
- Predicate is head
- ► Types:
 - Equational
 - Attributional
 - Locational

Disfluencies

The reparandum relation:

Disfluencies that are overridden in speech repair.

The goeswith relation:

Parts of words due to orthographical or processing errors.
